

SCOUT

Know What You're Running Before You Decide What Changes

THE COST OF NOT KNOWING WHAT YOU RUN

Most organizations don't lack systems. They lack a current, trustworthy picture of the systems they already have. Systems accumulate for years. Ownership changes hands. The people who understood a system when it was built move on, and the knowledge goes with them. A spreadsheet of application names doesn't fix this. It says nothing about what a system does, what data it holds, or whether the vendor still supports it.

This is decision-making without a map.

The challenge is no longer simply listing what you run. The challenge is knowing enough about each system to decide, with confidence, what happens to it next.

INTRODUCING SCOUT

When a deal closes, an integration team inherits systems it didn't build and may not fully understand, organized however the acquired business happened to organize them. When a CIO arrives at a new organization, or any IT leader takes stock of an existing one, the gap shows up more slowly, but it's the same gap: nobody currently holds an accurate map of what the business runs.

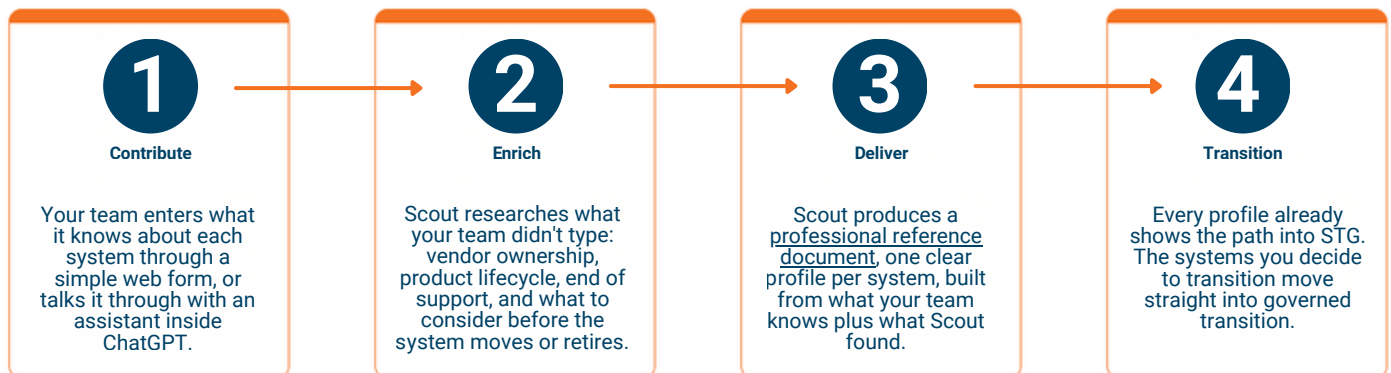

Scout is Sunset Point's answer to the moment before that decision gets made. It captures what a team already knows about each system, researches what it doesn't, and turns both into a clean, professional inventory, one profile per system, covering what it does, what it holds, and whether it's still supported.

USE SCOUT NOW

SCOUT MAKES SURE THE DECISION, WHOEVER MAKES IT, STARTS FROM THE FACTS.

READY TO SEE WHAT YOU'RE RUNNING?

Every transition decision starts somewhere. Most organizations start it without an accurate picture of what they're deciding about. Scout gives you that picture first, for free, and every profile it produces already points toward what comes next.
